Is The H1N1 Vaccine Safe? Shocking Stories From Pregnant Women Who Have Had Miscarriages After Taking The Swine Flu Vaccine

U.S. health authorities have made pregnant women one of the highest priority groups for getting the H1N1 swine flu vaccine, but is it actually safe for pregnant women and their babies? Well, the truth is that miscarriage reports from pregnant women who have taken the H1N1 swine flu vaccine are starting to pour in from all over the nation. Vaccines and pregnancy simply do not mix safely. In fact, the package inserts for the swine flu vaccines actually say that the safety of these vaccines for pregnant women has not been established.

What you are about to read below should shock and anger you. If they are telling us that the swine flu vaccine is not safe for children under 6 months of age, then why in the world would it be safe for pregnant women and their babies? That doesn't make an ounce of sense, does it?

The following H1N1 swine flu vaccine miscarriage horror stories [are from a June 2010 birth club](#).....

EBWashington:

I am so upset. I was so excited to be pregnant after trying for a year. As soon as I found out I was pregnant, I joined this birth club and I was due June 25th. We have two healthy boys with no history of miscarriage. Everything was going great. Last Monday, I got the H1N1 vaccine thimerosal reduced (mercury reduced for pregnant women). On Tuesday morning, I started cramping and on Wednesday I started bleeding heavily. My hcg was 50 on Wednesday and I was almost 6 weeks along so it was low. They still thought that I might be pregnant but on Friday my hcg was down to 22. I am an emotional wreck. I feel like I had a healthy baby and I caused this by getting the H1N1 vaccine. My doctors pushed it. I researched online and there have been many miscarriages after the H1N1 vaccine but they haven't been reported since it is hard to say what caused the miscarriages. I hope that I did not cause this. I wish everyone the best.

Tayla08

I don't have an answer for you, but a friend of a friend just had a miscarriage 2-3 days after getting the shot. She was 7weeks. She had no previous history of m/c... No one can answer if they're related...it hasn't been out long enough and there haven't been any studies done on pregnant women. I will tell you, that it has made up my mind on getting it...I won't and I'm not going to get it for my DD either. My daughter and I both had H1N1 last week, and although it truly sucks...I think I'll take my chances. One doctor will tell you to get it and the next will tell you not too...you have to do what's in your heart.

90707

my heart goes out to you as i recently miscarried as well and was due in june. i had a healthy heart beat at 6wks. then at 7.5 wks my son got the h1n1 mist vaccine which has live vaccine in it. the nurse said to be careful b/c it could technically spread if he rubbed his nose and touched a surface etc. the next night i miscarried and 5 days later was diagnosed with h1n1. i work from home, kids are home, hadnt been anywhere during that time. so the chances that it is all related are very high. the flu mist vaccine warns for immunocompromised patients (which includes prego) to stay away from recipients of the flu mist for 21 days.

This next set of H1N1 swine flu vaccine miscarriage horror stories [is from an About.com page about miscarriage](#).....

Jo:

I got the flu vaccine (regular not H1N1) at 8 weeks pregnant. Three days later I miscarried. I am not going to get the H1N1.

Regrets:

I got both vaccines on Thursday. I was 9 weeks pregnant. I miscarried on Sunday. I was told by several doctors to get these vaccines. Now I wish I followed my gut feeling and not get them at ALL!

☹ :

i work in a hospital like setting and was told "the benefits outweigh the risks" 1am i got the vaccine, 3am i started bleeding and craming, 3pm miscarried. you decide

sue:

I had the H1N1 vaccination and 24 hours later had a miscarriage.

Linda Hill:

My daughter in law was 10 weeks pregnant and had the H1N1 vaccine on Friday that night she miscarried.

SoSorry:

I was so ready to get the H1N1 vaccine last week and they were only giving them to pregnant women. I was 6 weeks along and got it and the next day I started cramping and miscarried. I already had two healthy pregnancies and never miscarried or had any problems. My doctors think I am crazy to think it was the H1N1 but if no one looks into this than other women will not know. I am so sorry that I got it.

Connie:

I also received the H1N1 vaccination on October 22nd, 2009 and went into labor on October 25th, at 16 weeks pregnant and we just heard the heartbeat and everything was fine with my pregnancy on October 16th, 2009, then on October 28th my water broke then on October 29th, I delivered a stillborn baby boy, and no one can tell me why...Everyone wants to say it did not come from the shot but I believe it did. My baby was growing at the correct pace and everyone wants to brush off the vaccination. I say if you have the vaccination and suffer a miscarriage if they are able to perform an autopsy have it done.

I also agree something needs to be done and looked more into with this vaccination because most women are being advised it's just something that happens, but I also had two healthy children normal pregnancies and when I received this vaccination with my third pregnancy, my baby is gone.

sioux falls, south dakota:

I received the H1N1 vaccine on October 16th and started experiencing cramping on the 22nd. I was nearly 17 weeks pregnant and gave birth to a stillborn baby boy on the 23rd. Like many of the other women here, the first thing I suspected was the H1N1 vaccine. I immediately asked a nurse at the hospital if that would have anything to do with it. Without hesitation, she told me "absolutely not." I had reservations about getting the vaccine, but followed the advice of my long trusted family doctor. In a follow up appointment with my doctor 3 days after I lost my baby, I asked him if the vaccine would have had any adverse effects on my baby. He also said that it was not possible. I don't believe that my doctor was necessarily lying to me, he was simply following the accepted practices and opinions of his field. I do, however, believe that as a nation, we are being lied to. This vaccine is NOT safe during pregnancy. There has not been enough testing done to determine this and there are far too many "coincidences" for this to be anything but a result of a vaccine that was hastily pushed into production and distribution in an effort to stop widespread panic. I have read so many stories in defense of the vaccine that will talk about how common miscarriages are, but I would challenge you to ask ANY health care professional how common second trimester miscarriages are. My baby was doing perfect developmentally and I had felt him move earlier that day. My heart goes out to all of you out there who have had to go through the same heartache and loss that I have had in the last couple of weeks. There is no reason that any woman or family should have to go through this. Get the word out to all of the pregnant women that you know. I know that if I had heard that women had been losing their babies shortly after they received the vaccine, I would have followed my gut and not gotten it myself. Maybe then Wyatt would have had a chance at life.

Marina Rossi:

I recently got the H1N1 vaccine and miscarried 3 days later. I thought it could have been the vaccine but didnt ask. After finding this site I believe it was the vaccine. Sorry to everyone else out there who has just experienced a miscarriage.

kathy-sd:

I'm from a town of 2000 in SD, there are several women pregnant and we are all due within a few weeks of each other. Four of us got the H1N1 vaccine 2 weeks ago and one by one each of us started to have preterm contractions. We are all due in Nov and Dec so we are further along than most of the people that lost their babies. There is no way you can tell us that our preterm labor was not caused by the H1N1 vaccine. It may look like a "fluke" to some people when these women are scattered all over the country but we are talking about 4 of us in our small community. My heart goes out to all of you that lost your babies.

ashley:

Im not sure but not only myself, i know someone that withing 4 days of getting the shot we both miscarried, i was only 6 weeks and she was 4 months along, not sure if the shot caused it and cant find any other information but i am a little concerned about this coincidence.

Time Machine:

I got a flu shot in pregnancy, developed incredibly strange symptoms immediately (numb hands, feet and mouth, heart palpitations, sudden weakness in my legs, a bright red face), began bleeding and miscarried by 11 weeks. I had no idea there was mercury in most flu shots but once I found out after the fact, I was assured that I'd had the "mercury free" form. As it turned out, the shot wasn't completely mercury free and, according to the EPA website, it still had 5,000 times the limit for mercury in drinking water- not to mention a list of other toxins (MSG, formaldehyde, etc.).

I'd had no idea the shots were so dirty. I guess I'd been under the impression they were something like sterile water and a dead virus, that's it.

The strange symptoms- which I'd been told were "just pregnancy" lasted six months. No one could figure out what was wrong with me, why I couldn't make stairs, why I felt like I'd been shot with novocaine. I learned later from a book by Jane Hightower that these were all symptoms of mercury exposure. I guess I'm one of those susceptible people. No one in my family is getting the H1N1- no one even gets regular flu shots anymore, we all read labels.

If you are a pregnant mother, please do not take the H1N1 swine flu vaccine. Instead, do everything that you can do to avoid public places and make sure to wash your hands more than you usually would. Take extra large doses of immunity building vitamins and research many of the great natural ways for fighting the flu that are out there on the Internet.

The truth is that if you do take the vaccine and then something happens, you will NOT be able to sue anyone (thanks to Congress). You will have to bear all the responsibility yourself. That doctor who kept pushing and pushing it on you will tell you that it could not have been the vaccine and that you probably would have miscarried anyway.

Do you honestly want to inject a vaccine that may contain mercury, formaldehyde, polysorbate 80 (associated with infertility), triton X100 (a strong detergent), phenoxyethanol (antifreeze) and a whole bunch of other toxic ingredients into your system when you know that your baby will absorb it too and has no defenses against most of these things?

In the very short video posted below, you will see one health expert explain to Sean Hannity that not even the swine flu vaccine package insert says that it is safe for pregnant women.....

The reality is that if you are pregnant, you need to hear what both sides have to say before ever subjecting your baby to the swine flu vaccine. You do NOT want to end up like one of the mothers above. Please help us out by sharing this information with as many people as you can. If you know of any additional H1N1 swine flu vaccine miscarriage horror stories please post them below in the comments section.

UPDATE: More Stories From Our Own Readers

AlinafromOz:

I had the normal Flu shot, and i had a miscarriage at 8wks... they told me it wasnt related pffft yeah right and now no way in hell i would get a barely tested H1N1 vaccine..

Kayte:

My husband's pregnant coworker (5 months along) called her doctor on the day they were giving the regular flu shots at work. He said she should get it. She did, and lost her baby the next week. This enrages and sickens me that the medical industry is pushing these shots on pregnant women and children, especially the new, little-tested, experimental H1N1 vaccine!

Kevin:

I work with someone who was 4 months pregnant. Her husband got swine flu, so both she and her son got the vaccine "just to be safe." A week later, she had a miscarriage. Any supposed benefits from the vaccine are clearly outweighed by the tremendous risks.

JK:

I was in support of vaccines and was comfortable with the fact that there is a national database that records "all" vaccine reactions so they can see trends and such - which is the info I got from my doctor.

Then, my daughter had a reaction to a vaccine at 18 months old. It was horrifying to watch her body swell for three days and not be able to do anything (Benadryl) slowed the swelling, but couldn't reverse it until three days had passed). I knew there were risks to vaccines, but it had seemed that the benefits outweighed the risks. I could have accepted that.

I was not prepared for the reaction of the medical community. My doctor's office refused to admit it was a reaction - even while she was swelling! They were concerned about the swelling, asked me if I knew how it started, then, when I mentioned that I suspected the vaccine they sent me home and said I was imagining things. A few hours later she had to go to the ER. Later I took her to an allergist who confirmed that it was a reaction. He told me that a lot of people react to the 3rd DTaP shot - even if they've been fine before. Still, he encouraged me to continue getting all the shots except for the last DTaP.

No one ever reported any of this to the national database.

My pediatrician pressured me to get more shots for my kids, but I refused. I've recently found out my kids' medical records falsely state that my kids DID get additional vaccines.

My daughter had been ahead on speech milestones at the time of the reaction, from that date (October) to the following July, she only learned 8 new words, and her language development froze. We've done three years of therapy now and she is in special ed.

Lynn:

My heart goes out to all who have suffered horrific events due to these vaccines. I have a beautiful 2 and 1/2 year old daughter who was born a month premature, at the time, all the health care practitioners involved in our lives strongly were pushing that she receive all the 'necessary' vaccines.... My mothers heart and gut reaction strongly said "no" but being a first time mom and feeling the pressures of our health care advisors I agreed to having her first set of shots done. Days later she developed a horrible 'chest cold' which never really cleared... she would have good days only to relapse into endless nights of trying to clear her little chest and holding her while she cried. Of course..... none of this was vaccine related. Then came time for her second set of shots... oh boy.... the stomach aches began... but our health unit would not stop calling until I made an appointment to bring her in, so, I did.... only agreeing to a select few of the vaccinations, resulting in more congestion topped with ear infections and many bouts of anti biotics. Her condition quickly spiraled downward into 2am visits to the hospital for a Ventilator because her chest was so tight each breath was a huge effort. Each doctor who saw her assured me that this was more common than I thought and that she would likely 'grow out of it'. Needless to say I will never let another vaccination needle touch her little body again. Weather our health system wants to admit it was related or not I cant help but believe that it was. Other than being small she was 100% healthy at birth and remained that way for 3 months.... until her first set of shots.

For many more testimonies from average people who have had their lives absolutely wrecked by the H1N1 vaccine, check out our new article entitled "**70 Heartbreaking Stories From People Who Have Had Their Lives Destroyed By H1N1 Swine Flu Vaccine Side Effects**" and please help get it out to as many people as possible. The truth is that the more these stories are shared, the more people will wake up and do their own research before subjecting themselves and their children to these shots.

Do we know if any of the women who lost their babies or any woman who has had the h1n1 vaccine has been able to get pregnant SINCE?

I saw a very disturbing video on youtube on immunocontraceptives in the h1n1 vaccine.

In all my years, I do not remember EVER seeing such a huge push for people to get a flu vaccine. THAT's 50 years. Do you remember anything like today? When we first started hearing about the spread of H1N1, the information was bogus because later the CDC admitted that they weren't really TESTING people to see if they actually had H1N1. Now they say most had the ordinary seasonal flu. So they lied when they said it was spreading rapidly.

When we have a blizzard, 9 months later we see a rise in the population levels. A baby boom. This happened in 78.

We have over 15 million Americans unemployed (likely more) and wouldn't we expect all those unemployed people who have so much time on their hands, to maybe generate another baby boom? More dependents would ADD to the cost of food stamps, welfare, etc.?

It will be VERY interesting to see if population levels go up or if they, for an 'unknown' reason, suddenly begin to decline. It would be very hard for people to prove that a vaccine caused them not to ovulate or to be able to carry a baby to full term. If you cannot produce the substance that was injected into you, you cannot prove if something caused a problem. There is no evidence.

The U.S. Government has done studies on U.S. citizens and members of the U.S military over the years. Obviously they did not know that they were being harmed at the time. It all came out later.

As a public health service to women, the Ohio Chapter of the National Coalition of Organized Women (NCOW) is currently collecting data from women who have experienced a miscarriage, stillbirth or complication in their pregnancy within one week of being administered the seasonal flu or the H1N1 vaccine. Please contact Connie at OHIODirectorNCOW@yahoo or 614-893-8775

I have to say I am sorry for all the losses I've read about on this page...It must be so painful to experience the loss of a child, even one you've never met.

I'm not a person who gets vaccines, but I am a school teacher in a school where we had multiple reported cases of H1N1. One of my students even got it and came to school before she knew what she had... I opted for the vaccine because this is my first pregnancy, I had been high risk and didn't want to take any chances. I take very good care of myself take vitamins, eat healthy, wash hands (as often as possible) but I cannot control my students habits or their parents. I can't force a parent to keep a sick child at home or to take them to the doctor, and I can't force students to cough or sneeze into tissues and then sanitize their hands.

Because of all these reasons I got the vaccine in November, from what I can tell I got VERY lucky! Thankfully I'm 28 weeks pregnant and my little boy is growing well and extremely active.

I think there needs to be more accountability for vaccines and doctors need to stop telling women that they would have miscarried anyway. I know many women will miscarry, and I know that there will always be stillbirths, but there seem to be too many coincidences. I don't think it's a government conspiracy but I do think that these companies should be held liable for doing appropriate research or at least keeping better records. I also agree with one of the above posters that studies should be done on miscarriages after the H1N1 vaccine is administered and compare it to the 20% average. I'm pretty sure they don't do this because they'll realize that there really is a problem...

I am so scared now, me and my wife had taken a H1N1 shot that made in Canada but we just found out that she is three weeks pregnant two days ago which means she was week pregnant when she took the vaccine. We are ecstatically happy with the baby but afraid of the influence of this vaccine. Does this vaccine can affect the fetus and it is growth in anyway? Is anybody can answer for this as soon as possible. If we know that we were pregnant i guess we would take the vaccine after reading all of these comments. My heart goes out to all the people who suffered because of this tragedy. Please tell me more about this vaccine! Can this affect the 1-10 week old baby. Specially 2-4 weeks old!!!!

Lou

"As a medical professional, I can tell you that the deception about vaccines runs very deeply in the medical community. I am horrified at the numbers of doctors and nurses who never do any research on the pro and cons."

WOW!

With a few more brave words like these from our medical professionals perhaps we, our children and young mothers have a chance.

[February 5th, 2010 at 11:17 pm](#)

THE INSERT FOR THE H1N clearly states in section 8:1 PREGNANCY category C: Animal reproduction studies have not been conducted with Influenza A (H1N1) 2009 Monovalent vaccine or AFLURIA. It is also not known whether these vaccines can cause fetal harm when administered to pregnant women or can affect reproduction capacity. Influenza A (H1N1) 2009 Monovalent vaccine should be given to pregnant women ONLY if clearly needed.

WORD FOR WORD!!!!!!

ALL vaccinations are a hoax and they are full of deathly poisons! Satan is crafty this way in destroying the masses. They want you to think that what I say and people like me in what I am saying are crazy. They brainwash the sheeple in so many ways that if you knew the truth you would be rebelling against these global A**holes that are involved with all of this. DO not trust ANY MAN! TRUST THE ONE AND ONLY TRUE GOD OF THE HOLY BIBLE and he will show you truth and discernment.

Danielle

[February 7th, 2010 at 3:20 pm](#)

I had the vaccine when I was only 4 weeks pregnant, and had no problems. I'm at 20 weeks right now and the baby is as healthy as ever!

What I find most worrying is that hCG (pregnancy hormone) has been administered in typhoid vaccines in poor countries. When hCG is added, the body not only develops antibodies against the carrier (flu virus, typhoid, etc.) but also develops antibodies against hCG. If the woman is pregnant, her body has this hormone and a battle begins to kill off the hormone. The hormone is necessary for the uterus to support a fetus. If the woman is not pregnant, she develops the antibodies and when she does become pregnant, her body produces hCG. The hCG antibodies then go to battle to kill this necessary hormone.

Any woman who has lost their baby or who has had this h1n1 vaccine should DEMAND that she be tested for anti-hCG antibodies. If they are present, she most likely will never conceive.

Remember that 'studies' have been conducted by pharmaceutical companies and it might also interest you to know that these same pharmaceutical companies have ties with the CDC, WHO and other government agencies.

NYC
February 19th, 2010 at 3:58 am

I also experienced a miscarriage within days of receiving the H1N1 shot. I had an ultrasound the same day as the vaccine at 8 weeks and a second ultrasound documented fetal demise approx. 3 days later.

PLEASE NOTE: For anyone who has experienced any reactions after the H1N1 shot, (especially a miscarriage) please complete this form so that it can be documented and turned into the CDC. It's the least you can do to document what has happened and to possibly prevent this from happening to others!!!

I've attached a link to the website: <http://vaers.hhs.gov/index>

Ted
February 19th, 2010 at 3:13 pm

If you are pregnant and are thinking about having an H1N1 inoculation in Canada, you most likely will have the unadjuvanted vaccine. As noted below, off the glaxosmithkline (manufacturers) website itself, under PRODUCT INFORMATION LEAFLET for FLUVIRAL® (our non-adjuvanted version)- Influenza A (H1N1) 2009 Pandemic Monovalent Vaccine (Without Adjuvant), it states clearly that there is 10 TIMES more mercury than the non-adjuvanted one. Thimerosal = 50mg, (or 25 micrograms)

List of Excipients

The vaccine is formulated with phosphate buffered saline composed of: sodium chloride, potassium chloride, sodium phosphate dibasic heptahydrate, potassium phosphate monobasic and water for injection. Thimerosal 50 µg per 0.5 mL dose is added as a preservative. The vaccine also contains trace residual amounts of egg proteins, formaldehyde, sodium deoxycholate and sucrose. Antibiotics are not used in the manufacture of this vaccine.

here is the link: [http://www.gsk.ca/english/docs-pdf/unadjuvated%20H1N1%20\(CAPU01-PIL%2001.1\).pdf](http://www.gsk.ca/english/docs-pdf/unadjuvated%20H1N1%20(CAPU01-PIL%2001.1).pdf)

compared to the adjuvanted version containing 5mg (or 2.5 micrograms):

2.0 QUALITATIVE AND QUANTITATIVE COMPOSITION

After combining and mixing the two components, 0.5mL of the resultant emulsion is withdrawn into a syringe for intramuscular injection. The final composition of each vaccine component per 0.5mL dose is as follows:

Antigen:

Split influenza virus, inactivated, containing antigen* equivalent to: A/California/7/2009 (H1N1)v-like strain (X-179A) 3.75µg HA** per 0.5mL dose

* isolated from virus propagated in eggs

** HA = haemagglutinin

Preservative content is 5µg Thimerosal USP per 0.5mL dose or 2.5 micrograms organic mercury (Hg) per 0.5mL dose.

The link is here: [http://www.gsk.ca/english/docs-pdf/Arepanrix%20H1N1%20CAPA02PIL%202.1%20\(2010-01-29\).pdf](http://www.gsk.ca/english/docs-pdf/Arepanrix%20H1N1%20CAPA02PIL%202.1%20(2010-01-29).pdf)

So, if you have the non-adjuvanted version, you are taking a vaccine with 10x's more mercury (thimerosal) than the adjuvanted one.

If you are pregnant, please avoid this vaccine altogether.

Kaye

This is a little different, but myself, my husband, and my 2 and 3 year olds got the live H1N1 while my little 3 month old baby was with us. Three days later my little baby was a "Near SIDS death". The doctors said it had nothing to do with our vaccines of course. I also had a seasonal flu shot while I was pregnant with this same baby... something I did not have with my other children. Just makes me wonder.

Eileen Dannemann
